

Method of managing the kinematics of a seat with a movable
squab

ABSTRACT OF THE TECHNICAL CONTENT OF THE INVENTION

The method of managing the kinematics of a seat (10) includes at least three seat elements (16, 18, 22) able to move with respect to each other and at least two actuators (26, 27) for moving the three elements (16, 18, 22) with respect to each other. When a first actuator (27) is actuated in at least one direction, it includes a step of actuating a second actuator (26) first of all in a given direction and then in the opposite direction.
